0. About

효과적인 차트란 어떤 것일까요?

- 사실을 왜곡하지 않고 올바른 정보를 전달하세요.
- 단순하지만 우아합니다. 많은 생각을 하지 않아도 이해할 수 있습니다.
- 미학은 정보를 가리기보다는 정보를 지원합니다.
- 너무 많은 정보를 담지 않습니다.

차트의 분류

- 아래 목록은 주요 용도에 따라 시각화 차트를 분류합니다.
- 차트는 크게 아래의 7가지 유형의 목표가 있습니다.
- 실제로 플롯을 만들기 전에 시각화를 통해 전달하거나 조사하고자 하는 결과에 대한 가설을 세우고 시작하십시오.
- 이마도 여러분이 필요한 차트는 아래 7가지 범주에 포함될 것입니다.

Correlation

The following plots help to examine how well correlated two variables are.

Scatterplot

the nature of relationship between two variables, invariably the first choice is the scatterplot. The most frequently used plot for data analysis is undoubtedly the scatterplot. Whenever you want to understand

by default, can be tweaked to draw the line of best fit by setting method='lm'It can be drawn using $geom_point()$. Additionally, $geom_smooth$ which draws a smoothing line (based on loess)

```
## Warning: Removed 15 rows containing missing values (geom_point).
                                                                                                                                                                                                                                                                                                                                                                                                                    gg <- ggplot(midwest, aes(x=area, y=poptotal)) +

Scatterplot With Encircling

When presenting the results, sometimes I would encirice certain special group of points or region in the chart so as to draw the attention to those peculiar cases. This can be conveniently done using the geom_encircle() in ggalt package.

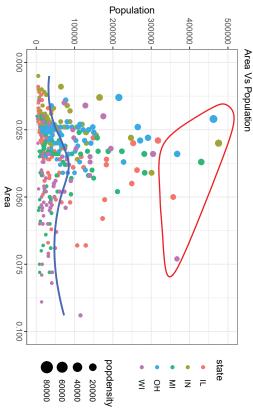

Within geom_encircle(), set the data to a new dataframe that contains only the points (rows) or interest. Moreover, You can expand the curve so as to pass just outside the points. The color and size (thickness) of the curve can be modified as well. See below example.

```
library(ggalt)
midwest_select <- midwest[midwest$poptotal > 350000 &
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    # devtools::install_github("hrbrmstr/ggalt")

Scatterplot + Encircle Area Vs Population

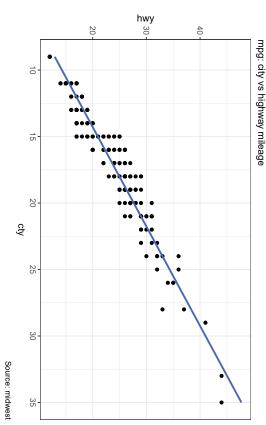

Source: midwest

Jitter Plot

highway mileage (hwy). Let's look at a new data to draw the scatterplot. This time, I will use the mpg dataset to plot city mileage (cty) vs

```
g + geom_point() +
                                                                                                                                                                                                                           # Scatterplot
                                                                                                                                                                                                                                                                                          g <- ggplot(mpg, aes(cty, hwy))
                                                                                                                                                                                                                                                                                                                                                         theme_set(theme_bw()) # pre-set the bw theme.
                                                                                                                                                                                                                                                                                                                                                                                        data(mpg, package="ggplot2") # alternate source: "http://goo.gl/uEeRGu")
                                                                                                                                                                                                                                                                                                                                                                                                                    library(ggplot2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                       # load package and data
                                                                                                                       labs(subtitle="mpg: city vs highway mileage",
                                                                                                                                                          geom_smooth(method="lm", se=F) +
title="Scatterplot with overlapping points",
caption="Source: midwest")
                                                                                                y="hwy",
```

Scatterplot with overlapping points

and this looks neat and gives a clear idea of how the city mileage (cty) and highway mileage (hwy) are well correlated. What we have here is a scatterplot of city and highway mileage in mpg dataset. We have seen a similar scatterplot

But, this innocent looking plot is hiding something. Can you find out?

```
## [1] 234 11
```

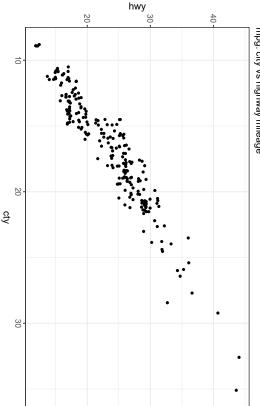

in the source dataset made it all the more convenient to hide this detail. So just be extra careful the next time you make scatterplot with integers because there are many overlapping points appearing as a single dot. The fact that both cty and hwy are integers The original data has 234 data points but the chart seems to display fewer points. What has happened? This is

by the width argument. So how to handle this? There are few options. We can make a jitter plot with jitter_geom(). As the name suggests, the overlapping points are randomly jittered around its original position based on a threshold controlled

```
theme_set(theme_bw()) # pre-set the bw theme.
                                                                                                                                                                                                                                                      data(mpg, package="ggplot2")
# mpg <- read.csv("http://goo.gl/uEeRGu")</pre>
                                                                                                                 g + geom_jitter(width = .5, size=1) +
                                                                                                                                            g <- ggplot(mpg, aes(cty, hwy))</pre>
                                                                                                                                                                                                     # Scatterplot
                                                                                                                                                                                                                                                                                                          library(ggplot2)
                                                                                                                                                                                                                                                                                                                                          # load package and data
                                                                                   labs(subtitle="mpg: city vs highway mileage",
x="cty",
title="Jittered Points")
                                                        y="hwy",
```

Jittered Points

mpg: city vs highway mileage

More points are revealed now. More the width, more the points are moved jittered from their original position.

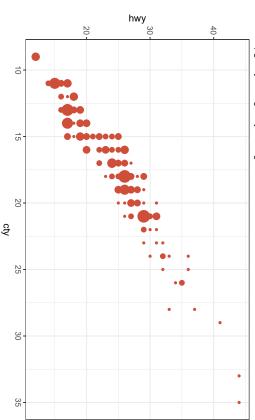

Counts Chart

there is more points overlap, the size of the circle gets bigger. The second option to overcome the problem of data points overlap is to use what is called a counts chart. Whereever

```
# Scatterplot
                                                                                                                                                                                                                                                              data(mpg, package="ggplot2")
# mpg <- read.csv("http://goo.gl/uEeRGu")</pre>
                                                                                                                   g + geom_count(col="tomato3", show.legend=F) +
                                                                                                                                                g <- ggplot(mpg, aes(cty, hwy))
                                                                                                                                                                               theme_set(theme_bw()) # pre-set the bw theme
                                                                                                                                                                                                                                                                                                                       library(ggplot2)
                                                                                                                                                                                                                                                                                                                                                      # load package and data
                                                                                     labs(subtitle="mpg: city vs highway mileage"
x="cty",
title="Counts Plot")
                                                           y="hwy",

Bubble plot

While scatterplot lets you compare the relationship between 2 continuous variables, bubble chart serves well if you want to understand relationship within the underlying groups based on:

of points). A Categorical variable (by changing the color) and Another continuous variable (by changing the size

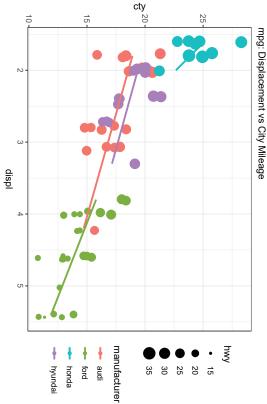

In simpler words, bubble charts are more suitable if you have 4-Dimensional data where two of them are numeric

(X and Y) and one other categorical (color) and another numeric variable (size).

best-fit varies, providing a better visual comparison between the groups. The bubble chart clearly distinguishes the range of displ between the manufacturers and how the slope of lines-of-

```
g <- ggplot(mpg_select, aes(displ, cty)) +
                                     g + geom_jitter(aes(col=manufacturer, size=hwy)) +
                                                                                                                                                                                                                                                         theme_set(theme_bw()) # pre-set the bw theme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 data(mpg, package="ggplot2")
# mpg <- read.csv("http://goo.gl/uEeRGu")</pre>
                                                                                                                                                                                                                                                                                                  # Scatterplot
                                                                                                                                                                                                                                                                                                                                                                              mpg_select <- mpg[mpg$manufacturer %in% c("audi", "ford", "honda", "hyundai"), ]</pre>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     # load package and data
geom_smooth(aes(col=manufacturer), method="lm", se=F)
                                                                                                                                                                  labs(subtitle="mpg: Displacement vs City Mileage",
                                                                                                                                title="Bubble chart")
```

Bubble chart

Marginal Histogram / Boxplot

If you want to show the relationship as well as the distribution in the same chart, use the marginal histogram. It has a histogram of the X and Y variables at the margins of the scatterplot.

This can be implemented using the ggMarginal() function from the 'ggExtra' package. Apart from a histogram, you could choose to draw a marginal boxplot or density plot by setting the respective type option.

```
ggMarginal(g, type = "boxplot", fill="transparent")
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          \label{eq:mpg_select} $$ mpg_select <- mpg[mpg$hwy >= 35 \& mpg$cty > 27, ] $$ g <- ggplot(mpg, aes(cty, hwy)) + $$
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         data(mpg, package="ggplot2")
# mpg <- read.csv("http://goo.gl/uEeRGu")</pre>
                                                                                                                                                                                                                                                                                                                                                                                                                                            ggMarginal(g, type = "histogram", fill="transparent")
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           theme_set(theme_bw()) # pre-set the bw theme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            # Scatterplot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            library(ggExtra)

                                                                                                                                                                                                                                                                       ПП
```

ggMarginal(g, type = "density", fill="transparent")

Correlogram

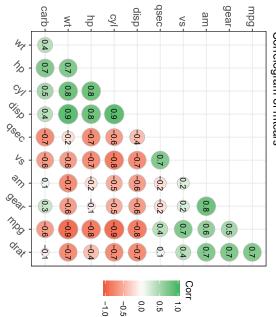

Correlogram let's you examine the corellation of multiple continuous variables present in the same dataframe. This is conveniently implemented using the ggcorrplot package.

```
# devtools::install_github("kassambara/ggcorrplot")
library(ggplot2)
library(ggcorrplot)

# Correlation matrix
data(mtcars)
corr <- round(cor(mtcars), 1)

# Plot
ggcorrplot(corr, hc.order = TRUE,
type = "lower",
lab = TRUE,
lab = TRUE,
lab = TRUE,
colors = c("tomato2", "white", "springgreen3"),
title="Correlogram of mtcars",
ggtheme=theme_bw)</pre>
```

Correlogram of mtcars

Deviation

Compare variation in values between small number of items (or categories) with respect to a fixed reference.

Diverging bars

Diverging Bars is a bar chart that can handle both negative and positive values. This can be implemented by a smart tweak with geom_bar(). But the usage of geom_bar() can be quite confusing. Thats because, it can be used to make a bar chart as well as a histogram. Let me explain.

By default, geom_bar() has the stat set to count. That means, when you provide just a continuous X variable (and no Y variable), it tries to make a histogram out of the data.

In order to make a bar chart create bars instead of histogram, you need to do two things.

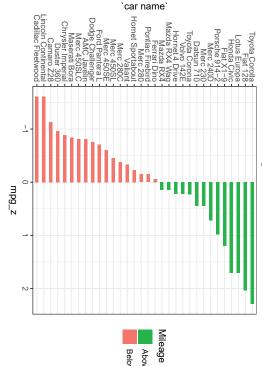

Set stat=Identity Provide both x and y inside aes() where, x is either character or factor and y is numeric. In order to make sure you get diverging bars instead of just bars, make sure, your categorical variable has 2 categories that changes values at a certain threshold of the continuous variable. In below example, the mpg from mtcars dataset is normalised by computing the z score. Those vehicles with mpg above zero are marked green and those below are marked red.

```
mtcars$^car name^ <- rownames(mtcars) # create new column for car names
mtcars$mpg_z <- round((mtcars$mpg - mean(mtcars$mpg))/sd(mtcars$mpg), 2)</pre>
                                                                                                                                                                                                                                                                                                                                                # Diverging Barcharts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mtcars%mpg_type <- ifelse(mtcars%mpg_z < 0, "below", "above") # above / below avg flag
                                                                                                                                                                                                                                                                                                ggplot(mtcars, aes(x=`car name`, y=mpg_z, label=mpg_z)) +
                                                                                                                                                                                                                                                                                                                                                                                                                               # convert to factor to retain sorted order in plot.

13

Diverging Bars

Normalised mileage from 'mtcars'

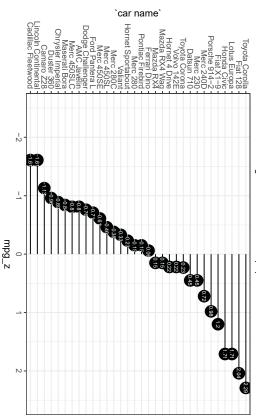

Above Average Below Average

Diverging Lollipop Chart

Lollipop chart conveys the same information as bar chart and diverging bar. Except that it looks more modem. Instead of geom_bar, I use geom_point and geom_segment to get the lollipops right. Let's draw a lollipop using the same data I prepared in the previous example of diverging bars.

Diverging Lollipop Chart

Normalized mileage from 'mtcars': Lollipop

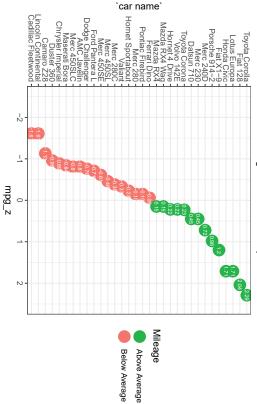

15

Diverging Dot Plot

Dot plot conveys similar information. The principles are same as what we saw in Diverging bars, except that only point are used. Below example uses the same data prepared in the diverging bars example.

Diverging Dot Plot

Normalized mileage from 'mtcars': Dotplot

Area Chart

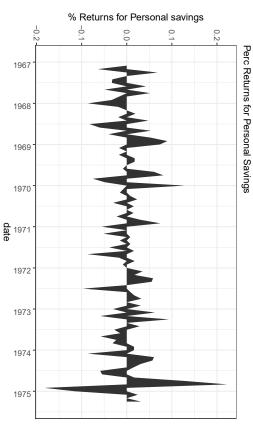

Area charts are typically used to visualize how a particular metric (such as % returns from a stock) performed compared to a certain baseline. Other types of % returns or % change data are also commonly used. The geom_area() implements this.

library(ggplot2)

Ranking

Used to compare the position or performance of multiple items with respect to each other. Actual values matters somewhat less than the ranking.

Ordered Bar Chart

variable (i.e. the categories) has to be converted into a factor. of interest isn't enough to order the bar chart. In order for the bar chart to retain the order of the rows, the X axis Ordered Bar Chart is a Bar Chart that is ordered by the Y axis variable. Just sorting the dataframe by the variable

before you draw the plot. Finally, the X variable is converted to a factor. Let's plot the mean city mileage for each manufacturer from mpg dataset. First, aggregate the data and sort it

Let's see how that is done.

```
cty_mpg <- cty_mpg[order(cty_mpg$mileage), ] # sort</pre>
                                                                                                                                     head(cty_mpg, 4)
                                                                                                                                                                                                                                                                                              cty_mpg <- aggregate(mpg$cty, by=list(mpg$manufacturer), FUN=mean) # aggregate
colnames(cty_mpg) <- c("make", "mileage") # change column names</pre>
                                                                                                                                                                                 # to retain the order in plot.
                                                                                                                                                                                                                      cty_mpg$make <- factor(cty_mpg$make, levels = cty_mpg$make)
                                                                                                                                                                                                                                                                                                                                                                             # Prepare data - group mean city mileage by manufacturer.
make mileage
lincoln 11.33333
land rover 11.50000
```

10 The X variable is now a factor, let's plot. mercury 13.25000

19

Ordered Bar Chart

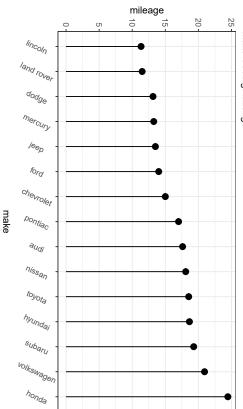

Lollipop Chart

Lollipop charts conveys the same information as in bar charts. By reducing the thick bars into thin lines, it reduces the clutter and lays more emphasis on the value. It looks nice and modern.

```
# Plot
                                                                                                                                                                                                                                                        ggplot(cty_mpg, aes(x=make, y=mileage)) +
                                                                                                                                                                                                                                                                                                                           theme_set(theme_bw())
                                                                                                                                                                                                                                                                                                                                                library(ggplot2)

Slope Chart

Slope charts are an excellent way of comparing the positional placements between 2 points on time. At the moment, there is no builtin function to construct this. Following code serves as a pointer about how you may approach this.

Dumbbell Plot

Dumbbell charts are a great tool if you wish to: 1. Visualize relative positions (like growth and decline) between two points in time. 2. Compare distance between two categories.

In order to get the correct ordering of the dumbbells, the Y variable should be a factor and the levels of the factor variable should be in the same order as it should appear in the plot.

```
gg <- ggplot(health, aes(x=pct_2013, xend=pct_2014, y=Area, group=Area)) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 theme_set(theme_classic())

4. Distribution

When you have lots and lots of data points and want to study where and how the data points are distributed.

Histogran

By default, if only one variable is supplied, the geom_bar() tries to calculate the count. In order for it to behave like a bar chart, the stat=identity option has to be set and x and y values must be provided.

Histogram on a continuous variable

Histogram on a continuous variable can be accomplished using either geom, bar () or geom_histogram (). When using geom_histogram (), you can control the number of bars using the bins option. Else, you can set the range covered by each bin using binwidth. The value of binwidth is on the same scale as the continuous variable on which histogram is built. Since, geom, histogram gives facility to control both number of bins as well as binwidth, it is the preferred option to create histogram on continuous variables.

```

Histogram on a categorical variable

Histogram on a categorical variable would result in a frequency chart showing bars for each category. By adjusting width, you can adjust the thickness of the bars.

library(ggplot2)
theme_set(theme_classic())

Histogram on a Categorical variable
g <- ggplot(mpg, aes(manufacturer))
g + geom_bar(aes(fill=class), width = 0.5) +
theme(axis.text.x = element_text(angle=65, vjust=0.6)) +
labs(title="Histogram on Categorical Variable",
subtitle="Manufacturer across Vehicle Classes")

Listogram on Categorical Variable

manufacturer

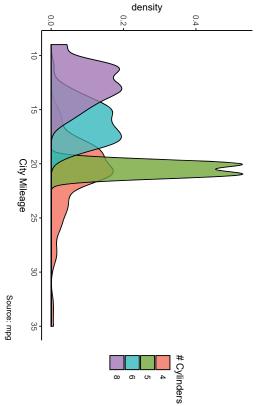

29

Density plot

```
library(ggplot2)
theme_set(theme_classic())

# Plot
g <- ggplot(mpg, aes(cty))
g + geom_density(aes(fill=factor(cyl)), alpha=0.8) +
    labs(title="Density plot",
        subtitle="City Mileage Grouped by Number of cylinders",
        caption="Source: mpg",
        x="City Mileage",
        fill="# Cylinders")</pre>
Density plot
```

City Mileage Grouped by Number of cylinders

Box Plot

Box plot is an excellent tool to study the distribution. It can also show the distributions within multiple groups, along with the median, range and outliers if any.

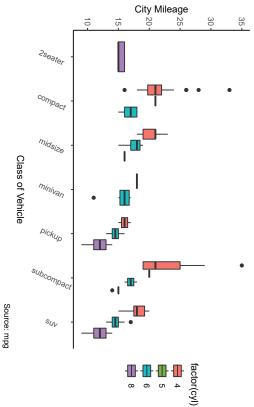

The dark line inside the box represents the median. The top of box is 75% lie and bottom of box is 25% lie. The end points of the lines (aka whiskers) is at a distance of 1.5* QR, where IQR or Inter Quartile Range is the distance between 25th and 75th percentiles. The points outside the whiskers are marked as dots and are normally considered as extreme points.

Setting varwidth=T adjusts the width of the boxes to be proportional to the number of observation it contains.

```
g <- ggplot(mpg, aes(class, cty))
g + geom_boxplot(varwidth=T, fill="plum") +
    labs(title="Box plot",</pre>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   # Plot
                                                                                                                                     City Mileage

Box plot
Box plot

City Mileage grouped by Class of vehicle

Source: mpg

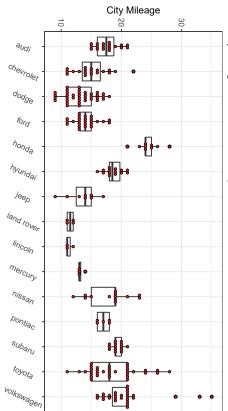

Dot + Box Plot

On top of the information provided by a box plot, the dot plot can provide more clear information in the form of summary statistics by each group. The dots are staggered such that each dot represents one observation. So, in below chart, the number of dots for a given manufacturer will match the number of rows of that manufacturer in source data.

`stat_bindot()` using `bins = 30`. Pick better value with `binwidth`

Box plot + Dot plot

City Mileage vs Class: Each dot represents 1 row in source data

Source: mpg

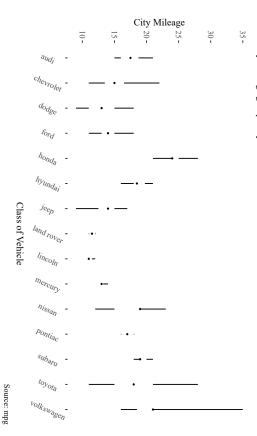

Class of Vehicle

Tufte Boxplot

Tufte box plot, provided by ggthemes package is inspired by the works of Edward Tufte. Tufte's Box plot is just a box plot made minimal and visually appealing.

Tufte Styled Boxplot

City Mileage grouped by Class of vehicle

Violin Plot

library(ggplot2)

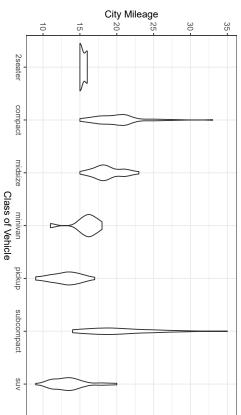

A violin plot is similar to box plot but shows the density within groups. Not much info provided as in boxplots. It can be drawn using geom_violin().

```
theme_set(theme_bw())

# plot
g <- ggplot(mpg, aes(class, cty))
g + geom_violin() +
  labs(title="Violin plot",
  subtitle="Oity Mileage vs Class of vehicle",
  caption="Source: mpg",
  x="Olass of vehicle",
  y="City Mileage")</pre>
```

Population Pyramid

Population pyramids offer a unique way of visualizing how much population or what percentage of population fall under a certain category. The below pyramid is an excellent example of how many users are retained at each stage of a email marketing campaign funnel.

library(ggplot2)
library(ggthemes)

```
ggplot(email_campaign_funnel, aes(x = Stage, y = Users, fill = Gender)) + # Fill column
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lbls = paste0(as.character(c(seq(15, 0, -5), seq(5, 15, 5))), "m")
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                brks <- seq(-15000000, 15000000, 5000000)

Waffle Chart

Waffle charts is a nice way of showing the categorical composition of the total population. Though there is no direct function, it can be articulated by smartly maneuvering the ggplot2 using geom_tile() function. The below template should help you create your own waffle.

```
ggplot(df, aes(x = x, y = y, fill = category)) +
    geom_tile(color = "black", size = 0.5) +
    scale_x_continuous(expand = c(0, 0)) +
    scale_y_continuous(expand = c(0, 0), trans = 'reverse') +
                                                                                                                                                                                                                                                                                                                                               df$category <- factor(rep(names(categ_table), categ_table))
# NOTE: if sum(categ_table) is not 100 (i.e. nrows^2),
# it will need adjustment to make the sum to 100.</pre>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        # # # # var

Pie Chart

Pie chart, a classic way of showing the compositions is equivalent to the waffle chart in terms of the information conveyed. But is a slightly tricky to implement in ggplot2 using the coord_polar().

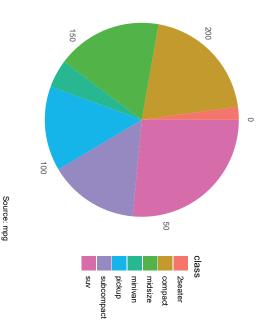

Pie Chart of class

http://www.r-graph-gallery.com/128-ring-or-donut-plot/

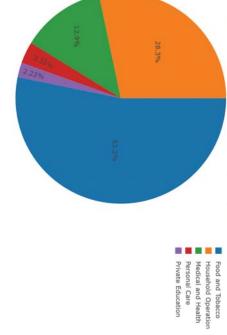

Sim: p1ot_1y는 ggp1ot2와 문법이 매우 비슷한 시각화패키지입니다. 아래의 코드를 실행하고 데이터셋의 이름과 변수의 이름만 잘 고치면 예쁜 파이차트를 만들 수 있습니다. (수강생 II/님의 아이디어로 추가했습니다.)

```

United States Personal Expenditures by Categories in 1960

Bar Chart

By default, geom_bar() has the statset to count. That means, when you provide just a continuous X variable (and no Y variable), it tries to make a histogram out of the data.

In order to make a bar chart create bars instead of histogram, you need to do two things

Set stat=identity Provide both x and y inside aes() where, x is either character or factor and y is

to compute the counts, you need to set the stat=identity inside the geom_bar(). you can adjust the thickness of the bars. If your data source is a frequency table, that is, if you don't want ggplot A bar chart can be drawn from a categorical column variable or from a separate frequency table. By adjusting width,

```

Time Series Plot From a Data Frame

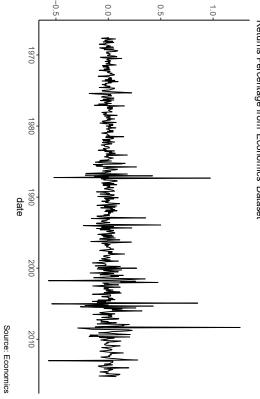

Using geom_line(), a time series (or line chart) can be drawn from a data.frame as well. The X axis breaks are generated by default. In below example, the breaks are formed once every 10 years.

Default X Axis Labels

```
ggplot(economics, aes(x=date)) +
                                                                                                                                                                                                                                   theme_set(theme_classic())
                                                                                                                                                                               # Allow Default X Axis Labels
                                                                                                                                                                                                                                                                library(ggplot2)

Time Series Plot From Long Data Format: Multiple Time Series in Same Dataframe Column

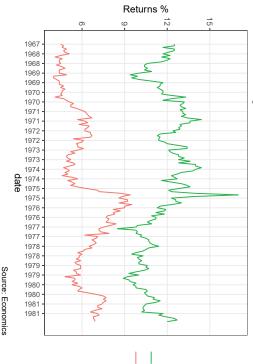

In this example, I construct the ggplot from a long data format. That means, the column names and respective values of all the columns are stacked in just 2 variables (variable and value respectively). If you were to convert this data to wide format, it would look like the economics dataset.

In below example, the geom_line is drawn for value column and the aes(col) is set to variable. This way, with just one call to geom_line, multiple colored lines are drawn, one each for each unique value in variable column. The scale_x_date() changes the X axis breaks and labels, and scale_color_manual changes the color of the lines.

Time Series of Returns Percentage Drawn from Long Data format

psavert uempmed

Time Series Plot From Wide Data Format: Data in Multiple Columns of Dataframe

As noted in the part 2 of this tutorial, whenever your plot's geom (like points, lines, bars, etc) changes the fill, size, col, shape or stroke based on another column, a legend is automatically drawn.

But if you are creating a time series (or even other types of plots) from a wide data format, you have to draw each line manually by calling geom_line() once for every line. So, a legend will not be drawn by default.

However, having a legend would still be nice. This can be done using the scale_aesthetic_manual() format of functions (like, scale_color_manual() if only the color of your lines change). Using this function, you can give a legend title with the name argument, tell what color the legend should take with the values argument and also set the legend labels.

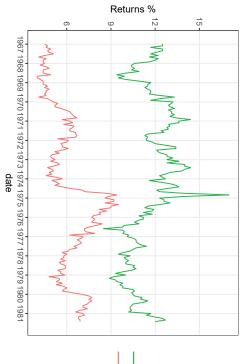

Even though the below plot looks exactly like the previous one, the approach to construct this is different.

You might wonder why I used this function in previous example for long data format as well. Note that, in previous example, it was used to change the color of the line only. Without scale_color_manual(), you would still have got a legend, but the lines would be of a different (default) color. But in current example, without scale_color_manual(), you wouldn't even have a legend. Try it out!

```
ggplot(df, aes(x=date)) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  # labels and breaks for X axis text
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       df <- economics[, c("date", "psavert", "uempmed")]

Time Series of Returns Percentage Drawn From Wide Data format

psavert uempmed

Source: Economics

Stacked Area Chart

Stacked area chart is just like a line chart, except that the region below the plot is all colored. This is typically used when:

You want to describe how a quantity or volume (rather than something like price) changed over time You have many data points. For very few data points, consider plotting a bar chart. You want to show the contribution from individual components. This can be plotted using geom_area which works very much like geom_line. But there is an important point to note. By default, each geom_area() starts from the bottom of Y axis (which is typically 0), but, if you want to show the contribution from individual components, you want the geom_area to be stacked over the top of previous component, rather than the floor of the plot itself. So, you have to add all the bottom layers while setting the y of geom_area.

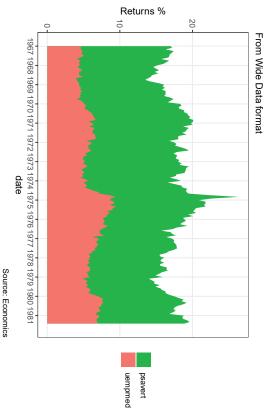

In below example, I have set it as y=psavert+uempmed for the topmost $geom_area()$

However nice the plot looks, the caveat is that, it can easily become complicated and uninterprettable if there are too many components.

```
ggplot(df, aes(x=date)) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          df <- economics[, c("date", "psavert", "uempmed")]

Area Chart of Returns Percentage

Calendar Heatmap

When you want to see the variation, especially the highs and lows, of a metric like stock price, on an actual calendar itself, the calendar heat map is a great tool. It emphasizes the variation visually over time rather than the actual

preparation rather than the plotting itself. This can be implemented using the geom_tile. But getting it in the right format has more to do with the data

```
## 1 2012

Seasonal Plot

If you are working with a time series object of class ts or xts, you can view the seasonal fluctuations through a seasonal plot drawn using forecast::ggseasonplot, Below is an example using the native AirPassengers and nottem time series.

Whereas Nottingham does not show an increase in overal temperatures over the years, but they definitely follow a seasonal pattern. You can see the traffic increase in air passengers over the years along with the repetitive seasonal patterns in traffic

```
nottem_small <- window(nottem, start=c(1920, 1), end=c(1925, 12))
                                 # Subset data
                                                                                                                             library(ggplot2)
                                                                                theme_set(theme_classic())
                                                                                                          library(forecast)
```

subset a smaller timewindow

ggseasonplot(AirPassengers) + labs(title="Seasonal plot: International Airline Passengers")

blank

Hierarchical Dendrogram

```
# install.packages("ggdendro")
library(ggplot2)
library(ggdendro)
theme_set(theme_bw())
```

hc <- hclust(dist(USArrests), "ave") # hierarchical clustering

plot ggdendrogram(hc, rotate = TRUE, size = 2)

Clusters

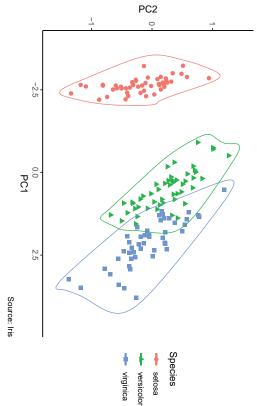

It is possible to show the distinct clusters or groups using geom_encircle(). If the dataset has multiple weak features, you can compute the principal components and draw a scatterplot using PC1 and PC2 as X and Y axis.

The geom_encircle() can be used to encircle the desired groups. The only thing to note is the data argument to geom_circle(). You need to provide a subsetted dataframe that contains only the observations (rows) that belong to the group as the data argument.

```
df_pc_ver <- df_pc[df_pc$Species == "versicolor", ] # df for 'versicolor'</pre>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  df_pc_vir <- df_pc[df_pc$Species == "virginica", ] # df for 'virginica'
